Plochemistry 33:5088-5108(1994).

Plochemistry of this toxin is a potent blocker of N-type calcium channels. This toxin is a potent blocker of N-type calcium channels. It also blocks L-type calcium channels, but with less potency than omega-Aga-IIIA. It does not block T-type channels. It blocks calcium currents in locust thoracic neurones, but does not block housefly neuromuscular transmission presynaptically.
                                                                                                                                                                                                                                                                                                                                                 Parol. Biol. 100. Mem. 267:2610-2615(1992).

-!- FUNCTION: Omega-agatoxin are antagonist of voltage-sensitive calcium channels. They block insect neuromuscular transmission presynaptically. Potent blocker of N- and L-type calcium channels.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom gland.
-!- FTW: Contains six disulfide bonds (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

-!- TISSUE SPECIFICITY: Expressed by the venom gland.
-!- PTM: Contains six disulfide bonds (Probable).
-!- SIMILARITY: Belongs to the omega-agatoxin family.

-! PUNCTION: Important for transcription initiation. The SPT4/5/6

-! PUNCTION: Important for transcription initiation. It may normally complex is required for transcription initiation. It may normally act to repress transcription at a variety of loci, and also plays a role in chromatin structure or assembly. Metal binding is important for its function (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Natl. Acad. Sci. U.S.A. 101:9081-9096 (2004).

-1- FUNCTION: This protein binds specifically to 23S rRNA. It makes multiple contacts with different domains of the 23S rRNA in the assembled 50S subunit and ribosome (By similarity).

-1- FUNCTION: The globular domain of the protein is located near the polypeptide exit tunnel on the outside of the subunit, while an extended beta-hairpin is found that lines the wall of the exit tunnel in the center of the 70S ribosome (By similarity).

-1- SUBUNIT: Part of the 50S ribosomal subunit.

-1- SIMILARITY: Belongs to the ribosomal protein L22P family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Listance of protein S6 is the major substrate of protein kinases in eukaryote ribosomes.

Linases in eukaryote ribosomes.

SMILARITY: Belongs to the ribosomal protein S6e family.
